

PAPAYA

Crop	Papaya Formosa
Location	Brazil
Problem	Water and soil salinity
Date	January 2017
Duration of study	10 months

A study was carried out by comparing the output obtained on two plots with identical conditions, one irrigated with untreated water and the other irrigated with water treated with Aqua4D®.

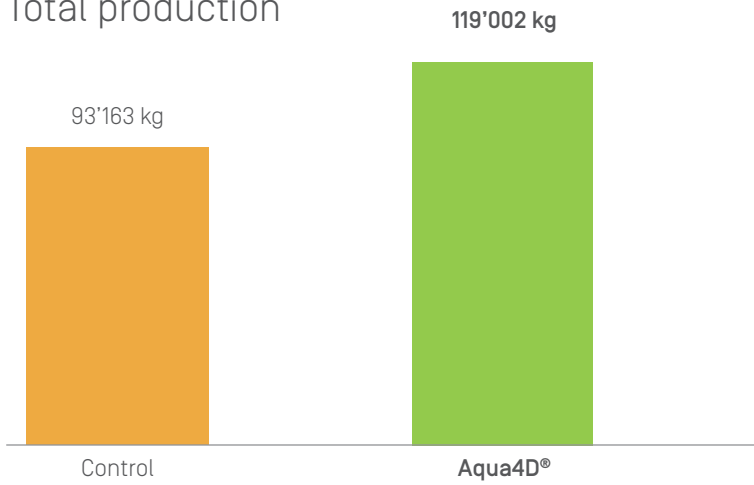

Aqua4D® allows for a general improvement in yields thanks to the synergies of its different actions. The improved dissolution and distribution of fertilizers in the water enhances its absorption by the plant.
